

Hello there,

I do have a pet lab install in my machine. I am using Virtual Box 6.1 just to play around with the a few technologies. What I do to the environment

1. Play around with commands
2. Implement containers like Dockers or Kubernetes
3. Learning what Python can do
4. Destroy configuration and fix it back
5. Testing out deployments

Basically, it's an environment just to play around with.
